

TraceBloom Website Walkthrough

TraceBloom is a front-end-only product journey mockup showing how a product moves from origin to final delivery. The design is responsive for large screens, tablets, and mobile screens.

What changed in this version

The journey section now uses a connected five-stage timeline inspired by the reference: Sourcing & Origin, Production & Processing, Quality Verification, Packaging & Branding, and Delivery & Confidence. Desktop uses a horizontal connected line; mobile uses a vertical connected timeline.

How to run

Step	Instruction
1	Extract tracebloom_web_build.zip.
2	Open index.html in a browser or host the folder on any static server.
3	Use sample codes such as TB-TEA-001, TB-SAF-002, TB-COT-003, or TB-SPC-004.

Files delivered

tracebloom_web_build.zip, tracebloom_web_source.zip, tracebloom_sample_journey_data.json, tracebloom_walkthrough.pdf, and tracebloom_handoff_notes.txt.

Technical notes

There is no real backend, live GPS, or external API. The website loads sample product journeys from the local JSON file and also contains fallback data inside the JavaScript so the trace code demo works in local/offline previews.
